Mechanical hand tools

High quality, crimp performance and ergonomics are prime considerations of Elpress when developing mechanical crimp tools. Except for the hobby tools, all Elpress crimp tools have a full closure, ratchet mechanism to ensure correct crimps at all instances - a prerequisite for professional and quality assured work.

With the unique Miniforce range of crimp tools, a new level of performance was established when speaking of ergonomic adaptation to the user and of low handle forces needed. A reduction of required force up to 45% is reached as a result of advanced ergonomic studies where minimised risk for work discomfort or even injuries was the main objective.

Miniforce type C has extra long handles for an easy two-hand grip which in most cases represents a simple and natural way of lowering work loads.

Elpress tools and terminals/connectors together form a Crimp System where the crimp results are supervised to meet requirements of established standards like SEN 245010, DIN46249 and other.

Many of the most common tools have symmetrical crimp die nests to enable crimps from both tool sides - a feature certainly appreciated by left-handed users.

All Miniforce type E- and D-tools are produced from high grade Swedish steel with black finish surface and comprehensive laser markings.

The ergonomic Elpress Miniforce tool.

Certification of crimp tools

Elpress has introduced a unique certification of all crimp tools of E- (Miniforce) and D-type.

What is certified?
The certification of Elpress crimp tools comprises individual documentation from final assembly and inspection regarding:

- handle pre-load, which is the force needed to release the crimp completion ratchet
- crimp die nest heights, which means each of the greatest nest heights to be measures with completely closed dies.

Why certification?
The certificate that accompanies the tool has several functions:

- New crimp tools are often immediately introduced into a QA system. The tool status before use is then of course to be the first log entry. Later periodic inspection recordings may then form base for detection of changes or wear and of possibly necessary corrective actions.
- The certificate shows that each individual tool meets the design specifications before supply.
- The certificate indicates the most important tool properties to be followed up.
